COMPSCI/SFWRENG 4AL3: Applications of Machine Learning

Fall 2026

1 Team Purpose

Our project is to automatically segment brain tumors (adult gliomas) in MRI scans. We will build a 2D U-Net, a type of convolutional neural network, using the BraTS dataset. For each axial slice, the model takes four MRI sequences (T1, T1CE, T2, and T2-FLAIR) as input and labels every pixel as background or as one of the tumor regions.

Our mission is to work together as a team to build, evaluate, and clearly report on a model that handles these challenges, while learning from each other and respecting each member's time and ideas.

2 Roles and Responsibilities

2.1 Shared Responsibilities

- **Contributions:** Each member contributes a fair share of the technical and written work. Tasks are divided based on interest, skills, and availability and we plan to rebalance as the project evolves so that no one is overloaded.
- **Deadlines:** We set internal deadlines at least 12 hours before each course deadline to leave time for review and fixes. Members complete tasks by the agreed date or tell the team as early as possible if they cannot. This is tracked by GitHub issues.
- **Communication:** Members respond to team messages within 24 hours and sooner as a deadline approaches. We will communicate in a timely manner about illness, heavy workloads in other courses, or other obligations that might affect our availability.
- **Reviewing each other's work:** Every piece of work is reviewed by at least one other member before it is considered final. Feedback shall be recorded by github comments on pull requests from feature branch to main.

2.2 Individual Roles

Each member is expected to attend meetings, complete assigned tasks on time and communicate honestly about progress and problems and help teammates when they are stuck. Everyone supports each other and contributes across all areas.

- **Salma Baig (domain knowledge, analysis, and reporting):**

- Explain the medical background to the team, including the BraTS tumor sub-regions and how they appear on each MRI sequence.
- Check that the data and labels make sense (e.g review sample slices and masks, and confirm the label mapping).
- Lead the visual inspection of predicted masks and the error analysis (missed tumors, inaccurate boundaries, differences between tumor sub-regions).
- Interpret results in a clinical context.
- Lead the writing of the background and discussion sections of the report.

- **Yashika Yashika (modeling and training):**

- Implement the baseline fully convolutional model and the 2D U-Net in PyTorch.
- Implement the loss functions (cross-entropy and Dice + cross-entropy).
- Write and run the training loops and tune hyperparameters on the validation set, using the same training budget for both models.
- Track experiments and save model checkpoints and training logs.
- Lead the writing of the methods and training sections of the report.

- **Lucas Zheng (data pipeline, evaluation, and infrastructure):**

- Download the dataset and build the preprocessing pipeline (z-score normalization, channel stacking, axial slice extraction, augmentation).
- Create the subject-level train/validation/test split and the PyTorch data loaders.
- Implement the evaluation code: 3D Dice for whole tumor, tumor core, and enhancing tumor, plus parameter counts and inference time.
- Maintain the GitHub repository, branches, and project board, and keep the code reproducible (fixed seeds, documented dependencies).
- Lead the writing of the data and results sections of the report.

3 Team Management and Communication

- **Communication:** We use Discord for daily discussion and project-related matters. Moving forward, we will document each meeting and upload the notes to GitHub to track our progress. The responsibility for taking meeting notes will rotate among team members. For virtual meetings, we will use Microsoft Teams' transcription feature to capture the discussion.
- **Meetings:** We meet weekly, either in person or virtually depending on group availability. We plan to have extra meetings before major deadlines. Meeting times and locations are determined by shared availability. As such, members arrive on time and notify the team in advance if they must miss a meeting and they are responsible for catching up on what they missed by referring to meeting notes.
- **Task Management:** We assign and track tasks using GitHub Issues. Every task has an owner and a due date and owners update status as work progresses.
- **Code Review:** We work on feature branches and merge through pull requests. Each pull request needs at least one approval from a teammate who did not write the code before it is merged to the main branch. Reviews should be completed within 2 days, weekends included. We keep code readable and commented where needed for ease of reviewing.
- **Decision Making:** We aim for consensus after open discussion where everyone can share their opinion. If consensus cannot be reached, we vote and the majority decides. Major decisions such as changing the project scope or model design require additional feedback from TA and Professor.

4 Conflict Resolution

We expect disagreements to happen and view them as opportunities for constructive discussion and collaboration. Our process is:

1. **Talk directly first:** A member who has a concern raises it to the person involved, focusing on the specific issue and its effect on the overall project.
2. **Meet as a team:** If it is not resolved within a few days, we hold a team meeting dedicated to the issue. Each person gets to explain their perspective and we work toward a solution everyone can accept.

3. **Document the agreement:** We write down what was agreed in the meeting notes and check in at the next meeting.
4. **Escalate if needed:** If we cannot resolve the issue ourselves or a problem persists such as repeated missed deadlines or lack of contribution, we will bring it to our TA or Professor's attention for appropriate resolution.

5 Signatures

By signing below, we confirm that we agree to the expectations outlined in this contract.
